The content of the product: Corrosion can be caused by various effects of metals and alloys, electrochemical change or physical dissolution. The corrosion caused by the reaction of metals, which are of great importance in the industry and in the industry, with acids, is an undesirable situation and causes great material damage. There is work to reduce corrosion as well as reduce the corrosion of metals. In this project study, it is aimed to reduce the effect of corrosion observed in metals by inhibitor effect of flaxseed and by using massless method.

In this project corrosion of the metal parts used in the industry has been worked on. Particularly in air conditioner, car and metal parts of construction iron, it is aimed to reduce the corrosion by covering the corroded parts with mature extract. At the same time, offering price advantage in comparison with other materials used in this area and preparing environmentally friendly products constitute the main scope of the project.

Product;

- Extraction of flaxseed with distilled water is achieved.
- The production and application of our product is very easy and reliable compared to other chemical inhibitors.
- According to the ratios, it has a price advantage of 600% and efficiency of 80%.
- Waste does not harm nature as it is a natural product.
- With the ongoing ARGE activities on the product, it will be created in different product range like rust remover.
